ASN.1 templating for fun and profit

William Robinet

2023-07-05

#pts23

About me

- CompSci studies, work in IT (Conostix S.A. – AS197692)
- SSLDump improvements (build system, JSON output, IPv6 & ja3(s) support, ...)

PEM file – an X.509 certificate

```
-----BEGIN CERTIFICATE-----
MIIFPzCCBCegAwIBAgISBN0YAhlGh1UW5NyEQUR1P6NeMA0GCSqGSIb3DQEBCwUA
MDIxCzAJBgNVBAYTAlVTMRYwFAYDVQQKEw1MZXQncyBFbmNyeXB0MQswCQYDVQQD
[...]
/4bgeLYcnWuE2oydoR9Vr/PpKGZcefWrb5oNu5Ttuui6VwD2edlM8IcVG+nOKFKH
bydJ2Ra5KFCmBmkFq8ZVi6zHlLdvk8B5qIeaq7VsRycPFsEUc9mjFI7gO4vBaHkc
gPzk
-----END CERTIFICATE-----
```

Transport over text channels – PEM

- Privacy-Enhanced Mail
- IETF RFC 1421 and IETF RFC 7468
- Base64 + surrounding BEGIN/END tags
- Useful for transport of binary structures over text-based channels such as email

Transport over text channels – PEM (2)

Valid types (from openssl-format-options(1)):

RSA PUBLIC KEY	ECDSA PUBLIC KEY
X509 CERTIFICATE	ENCRYPTED PRIVATE KEY
DSA PRIVATE KEY	PARAMETERS
NEW CERTIFICATE REQUEST	PKCS #7 SIGNED DATA
ANY PRIVATE KEY	PKCS7
CERTIFICATE	PRIVATE KEY
CERTIFICATE REQUEST	PUBLIC KEY
CMS	RSA PRIVATE KEY
DH PARAMETERS	SSL SESSION PARAMETERS
DSA PARAMETERS	TRUSTED CERTIFICATE
DSA PUBLIC KEY	X509 CRL
EC PARAMETERS	X9.42 DH PARAMETERS
EC PRIVATE KEY

[...]
```

Binary Encoded file (4)

```
$ man openssl-asn1parse
[...]
NAME
       openssl-asn1parse, asn1parse - ASN.1 parsing tool
[..]
DESCRIPTION
       The asn1parse command is a diagnostic utility that can parse
       ASN.1 structures. It can also be used to extract data from ASN.1
       formatted data.
[...]
```

Binary Encoded file (5)

```
$ openssl asn1parse -in certificate.der -inform D -i
    0:d=0  hl=4 l=1343 cons: SEQUENCE

```

ASN.1 Example – RSA private key

```
RSAPrivateKey ::= SEQUENCE {
    version  Version,
    modulus  INTEGER,  -- n
    publicExponent  INTEGER,  -- e
    privateExponent  INTEGER,  -- d
    prime1  INTEGER,  -- p
    prime2  INTEGER,  -- q
    exponent1  INTEGER,  -- d mod (p-1)
    exponent2  INTEGER,  -- d mod (q-1)
    coefficient  INTEGER,  -- (inverse of q) mod p
    otherPrimeInfos  OtherPrimeInfos OPTIONAL
}

Version ::= INTEGER

OtherPrimeInfos ::= SEQUENCE OF OtherPrimeInfo

OtherPrimeInfo ::= SEQUENCE {
    prime INTEGER, -- ri
    exponent INTEGER, -- di
    coefficient INTEGER -- ti
}
```

Abstract Syntax Notation One

- Standard interface description language (IDL)
- Used to define data structures that can be serialized and deserialized in a cross-platform way[2]
- ITU-T & ISO/IEC standard from the 80's
- Used in PKCS, X.500, LDAP, Kerberos, SNMP, EMV, GSM, UMTS, LTE, 5G, ...
- Our use case is the definition of cryptographic structures such as X.509 certificates, RSA/EC keys, ...
- Recommended reading: `https://letsencrypt.org/docs/a-warm-welcome-to-asn1-and-der/`

[1] Source: `https://en.wikipedia.org/wiki/ASN.1`

ASN.1 Tags

Basic types (primitive)	**Structured types (constructed)**
BOOLEAN	SEQUENCE, SEQUENCE OF
INTEGER	SET, SET OF
NULL	
OID	
UTCTIME, GENERALIZEDTIME	
OCTET STRING	
BIT STRING	
UTF8String, PRINTABLESTRING, ...	
ENUM	

ASN.1 Tag Classes

- Specify encoding instructions in order to remove ambiguity where necessary
- It helps defining our own tags using a class and a tag value (uint $< 2^{31} - 1$)
- Available classes are:
  UNIVERSAL, **A**PPLICATION, **C**ONTEXT SPECIFIC or **P**RIVATE
- Classes encoding can be IMPLICIT or EXPLICIT

Binary Encodings

- **BER – Basic Encoding Rules**
- **DER – Distinguished Encoding Rules**
- CER – Canonical Encoding Rules
- PER – Basic Packed Encoding Rules (Aligned/Unaligned)
- CPER – Canonical Packed Encoding Rules (Aligned/Unaligned)
- XER – Basic XML Encoding Rules
- CXER – Canonical XML Encoding Rules
- EXER – Extended XML Encoding Rules
- OER – Octet Encoding Rules
- JER – JSON Encoding Rules
- GSER – Generic String Encoding Rules
- SER – Signalling Specific Encoding Rules
- LWER – Lightweight Encoding Rules
- MBER – Minimum Bit Encoding Rules

BER/DER structures encodings

BER – Basic Encoding Rules

DER – Distinguished Encoding Rules

- Byte based binary formats
- TLV – Type/Tag, Length, Value

- BER allows encoding of a given ASN.1 structure in multiple ways
- BER is useful for streams (content not known in advance)

- DER is a subset of BER along with canonicalization rules
- DER only allows a single encoding for a given ASN.1 structure
- That's why it is used for signed data structures (fixed content)

ASN.1/DER Tags encoding

Tag value (hex)	Tag
02	INTEGER
03	BIT STRING
04	OCTET STRING
05	NULL
06	OBJECT IDENTIFIER
0C	UTF8String
10(Constructed → 30)	SEQUENCE and SEQUENCE OF
11(Constructed → 31)	SET and SET OF
13	PrintableString
16	IA5String
17	UTCTime
18	GeneralizedTime

Bit #6 indicates a Constructed tag compared to a Primitive tag

Source: `https://letsencrypt.org/docs/a-warm-welcome-to-asn1-and-der/`

ASN.1/DER Tag Class encoding

Bits #8 & #7 are use for class encoding

Class	**Bit #8**	**Bit #7**
Universal	0	0
Application	0	1
Context-specific	1	0
Private	1	1

Source: `https://letsencrypt.org/docs/a-warm-welcome-to-asn1-and-der/`

DER encoding examples (2)

```
my_struct ::= SEQUENCE {
    int0 INTEGER:0x12
    int1 INTEGER:0x34
}
```

```
/--> type: SEQUENCE
/  /--> length: 6 bytes
/  /  /////////////////--> value: the two DER encoded INTEGERs
30 06 02 01 12 02 01 34
      /  /  /  /  /  /--> value: 0x34
      /  /  /  /  /--> length: 1 byte
      /  /  /  /--> type: INTEGER
      /  /  /--> value: 0x12
      /  /--> length: 1 byte
      /--> type: INTEGER
```

DER encoding examples (2)

```
my_struct ::= SEQUENCE {
    int0 INTEGER:0x12
    int1 INTEGER:0x34
}
```

```
/--> type: SEQUENCE
/  /--> length: 6 bytes
/  /  /////////////////--> value: the two DER encoded INTEGERs
30 06 02 01 12 02 01 34
      /  /  /  /  /  /--> value: 0x34
      /  /  /  /  /--> length: 1 byte
      /  /  /  /--> type: INTEGER
      /  /  /--> value: 0x12
      /  /--> length: 1 byte
      /--> type: INTEGER
```

How do we edit these kind of structures ?

Motivation, why would you want to do this ?

- Exploiting known vulnerabilities
- Testing the limits ! (fuzzing)

DER editing manual example

```
SEQUENCE:
    INTEGER:0x12            30 06 02 01 12 02 01 34
    INTEGER:0x34

SEQUENCE:
    INTEGER:0x12
    INTEGER:0x3456

   /--> Outer SEQUENCE is now 7 bytes long
   /             /--> second INTEGER in outer SEQUENCE is now
   /             /                                   2 bytes long
30 07 02 01 12 02 02 34 56
```

DER editing manual example

```
SEQUENCE:
    INTEGER:0x12            30 06 02 01 12 02 01 34
    INTEGER:0x34

SEQUENCE:
    INTEGER:0x12
    INTEGER:0x3456

   /--> Outer SEQUENCE is now 7 bytes long
   /             /--> second INTEGER in outer SEQUENCE is now
   /             /                                   2 bytes long
30 07 02 01 12 02 02 34 56
```

DER editing manual example

```
SEQUENCE:
    INTEGER:0x12            30 06 02 01 12 02 01 34
    INTEGER:0x34

SEQUENCE:
    INTEGER:0x12
    INTEGER:0x3456
```

```
   /--> Outer SEQUENCE is now 7 bytes long
   /             /--> second INTEGER in outer SEQUENCE is now
   /             /                                   2 bytes long
30 07 02 01 12 02 02 34 56
```

DER editing manual example (2)

Larger structures composed of multiple depth of nested sub-structures are a pain to edit.

```
ssl@ssl:~/workchen/cve$ openssl asn1parse -in cert.der -inform DER -i
    0:d=0  hl=4 l= 549 cons: SEQUENCE
    4:d=1  hl=4 l= 460 cons:  SEQUENCE
    8:d=2  hl=2 l=   3 cons:   cont [ 0 ]
   10:d=3  hl=2 l=   1 prim:    INTEGER           :02
   13:d=2  hl=2 l=  20 prim:   INTEGER           :2E4B7AE3D7E3BF14B77B3914FC0B7C50AC3303E9

  183:d=6  hl=2 l=  32 prim:       OCTET STRING      [HEX DUMP]:FFFFFFFF0000000100000000000000000000000000000000FFFFFFFFFFFFFFFFFFFFFFFC
  217:d=6  hl=2 l=  32 prim:       OCTET STRING      [HEX DUMP]:5AC635D8AA3A93E7B3EBBD55769886BC651D06B0CC53B0F63BCE3C3E27D2604B
```

A solution

The “‘asn1template.pl‘“ script – Idea

```
$ man openssl-asn1parse
[...]
-genstr string, -genconf file
    Generate encoded data based on string, file or both
    using ASN1_generate_nconf(3) format. If file only is
    present then the string is obtained from the default
    section using the name asn1. The encoded data is passed
    through the ASN1 parser and printed out as though it
    came from a file, the contents can thus be examined and
    written to a file using the out option.
[...]
```

The “‘asn1template.pl“‘ script – How it works

Internal structure of the script:

- Read the output of the “‘asn1parse“‘ OpenSSL app
  (a **representation** of the tree structure)
- Reconstruct the ASN.1 structure tree
- Traverse the tree recursively, depth-first
- and write the “‘-genconf“‘ compatible output “‘ASN1_generate_nconf(3)“‘
  (a **description** of the tree structure)

- First version written around 2010. “‘der-ascii“‘ did not exist back then.
- Written in Perl, depends on the OpenSSL CLI utility

asn1parse – representation

```
$ openssl asn1parse -in test.der -i -inform D
    0:d=0  hl=2 l=  18 cons: SEQUENCE
    2:d=1  hl=2 l=   8 cons:  SEQUENCE
    4:d=2  hl=2 l=   6 cons:   SEQUENCE
    6:d=3  hl=2 l=   4 prim:    INTEGER           :76543210
   12:d=1  hl=2 l=   6 cons:  SEQUENCE
   14:d=2  hl=2 l=   4 prim:   INTEGER           :01234567
```

genconf option format – description

```
$ asn1template.pl test.der
asn1 = SEQUENCE:seq1@0-2-18
[seq1@0-2-18]
field2@2-2-8 = SEQUENCE:seq2@2-2-8
field3@12-2-6 = SEQUENCE:seq3@12-2-6
[seq2@2-2-8]
field4@4-2-6 = SEQUENCE:seq4@4-2-6
[seq4@4-2-6]
field5@6-2-4 = INTEGER:0x76543210
[seq3@12-2-6]
field6@14-2-4 = INTEGER:0x01234567
```

Demos: (More or less) recent DoS vulnerabilites in OpenSSL

- CVE-2022-0778 (`https://www.openssl.org/news/secadv/20220315.txt`)

  Infinite loop in BN_mod_sqrt() reachable when parsing certificates
  Edition of a certificate with the broken EC key parameters

- CVE-2023-2650 (`https://www.openssl.org/news/secadv/20230530.txt`)

  Possible DoS translating ASN.1 object identifiers
  Add a rididulously long OID to an existing structure

Alternative SSL/TLS tool suites

- Works with LibreSSL out of the box
- BoringSSL: genconf option not available, needs an additional helper tool
- ...

Improvements & future evolutions

- Fix IMPLICIT/EXPLICIT tagging
- Support missing data types
- Better encoding detection
- Support for binary fixers (indefinite length, out of standard values, ...)
- PR welcome :)
